

Kabaido, the AI Application Engineer

A digital employee that does the work of the industrial Application Engineer · not another tool an engineer has to operate. You send it the same enquiries you would send a colleague. It sends back finished quotes.

The configure–calculate–quote spine

Lives in email

Kabaido reads and replies in the inbox you already run. There is no implementation project and no new screen for the team to learn.

Layers on your ERP

It works on top of the ERP you already run, reading parts, customers and prices in place. Nothing is migrated and nothing is replaced.

Cites its sources, or abstains

Every specification, tolerance and price traces to a source you can open. Where the evidence is thin it asks rather than inventing an answer.

Who this fits. Built for the UK precision metal-cutting cluster · cutting tools, machined components and the firms that quote them. Most relevant where there is an open Application Engineer vacancy or a quoting backlog holding order intake back. Your engineers keep the judgement calls. Kabaido clears the queue underneath them.

Try it free on your next real RFQ.

No card and no project · forward one live enquiry and see the quote come back.
