

Software your business owns, not rents

Most manufacturing software is rented per user, per site or per module, so the bill rises as the business grows. Stellify builds bespoke systems from tested, pre-built modules rather than from scratch, so a system that would once have taken months costs a fraction of the time and money.

What we build

- Job and works order tracking
- Stock, materials and suppliers
- Quality and inspection records
- Certificate and expiry tracking
- Production scheduling
- Purchase and delivery records
- Documents and version history
- Reporting and audit trails

What we don't build

No machine control or PLC work, no CAD or CAM, no shop-floor hardware, and nothing safety-critical on the line. We build the business systems around production, and connect to your accounting, filing and existing equipment rather than replacing them.

How it works

A short written specification is agreed before any build starts. The system is assembled from modules that already exist and have been tested in production, then fitted to how your business actually works. It is delivered into accounts in your own name, so you own the software and the code outright. One-off build fee. No monthly licence. No per-user, per-site or per-module charge.

Suited to

- SMEs running spreadsheets alongside an ageing system
- Firms where off-the-shelf software doesn't fit the process
- Businesses whose software bill rises with headcount or sites
- Replacing or extending systems nobody maintains any more

Delivery

Delivered remotely across the UK. Based in Teesside, North East England.

Stellify Software is a UK company building bespoke Laravel applications from a library of reusable, production-tested modules.
