Intelligence for Integrations

The Condor platform is a web-based modular integration with rigorous user-specific security properties. It provides a central overview by connecting to multiple systems such as process control systems, ERP or PLC/SCADA.

This connection enables you to create and manage ingredients and finished products. Condor also allows you to manage and monitor a range of raw material parameters such as tolerances, densities, families, cross contamination, authorised routes, mixer settings, energy usage and many more.

Traceability and the tracking of materials is achieved by the real-time monitoring of lot information. Condor checks barcodes, lot codes and expiry dates across the production process for accuracy and efficiency.

Features

Energy
Track energy usage and carbon footprint by product and process

Scheduling
Build efficiency with intelligent production planning

Batch reporting
Customise batch reports with key information

Compliance
Consolidate and verify production data from multiple sources

Maintenance
Connect your computerised maintenance management directly to your machines

BEAUTIFUL INTEGRATIONS
All on one platform

The Condor platform has configurable modules, a range of integrations, and can be used with live installations.

It allows you to manage manufacturing settings for all systems and offer security management to ensure that only the approved personnel can make changes to production or settings.

You will seamlessly receive work orders from the ERP system and be able to view information and data on historical or current work orders. Batch data is automatically linked to work orders to optimise the live view of data.

You can use central planning and real-time updates to make scheduling, batching and sequence changes easy. Condor facilitates real-time production visualisation.
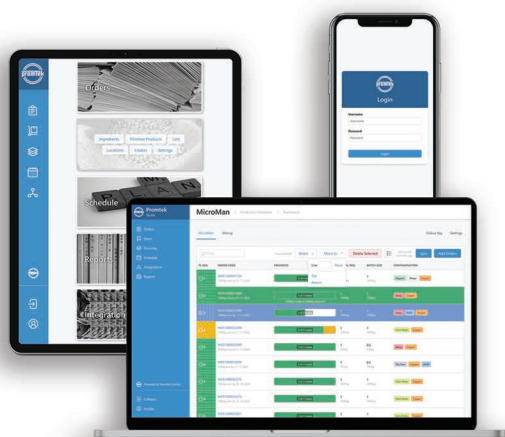

Condor provides reassurance that traceability and cross contamination are taken seriously as checks are done automatically after any change. Production will not be able to continue until any issues are fixed.

You can also use batch reports to improve traceability and use features such as file attachments and comment tools for future reference. All features can be customised and styled to fit your brand.

WHY USE OUR
Condor integration platform?

As production facilities become more complex, the amount of data produced by process control systems, sensors and barcodes increases exponentially. The costs of collecting information from independent suppliers that is needed for stock, scheduling, legislation, traceability and maintenance, becomes higher.

An integration platform enables all the information to be collected and managed in one place, creating trustworthy outputs, which can be customised to suit the changing needs of your organisation. The addition or upgrade of any plugins or applications can be done without any downtime.

Promtek is a vibrant, family-run business founded in 1972. Engineering is at the heart of everything we do. We provide expertise in designing and integrating process control and automation systems for a variety of ingredient handling and processing industries.
